ENGR421: Introduction to Machine Learning Fall 2020 – Homework 6 Ege Yelken – 61742

The aim of this assignment was to implement 2 clustering algorithms, namely k-means algorithm and Expectation-Maximization algorithm. I have followed the steps below:

1. Generated random samples with given parameters and plotted them:

```
class_means <- matrix(c(+2.5, +2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5, -2.5,
```

2. Ran the k-means algorithm twice with k = 5:

```
for(i in 1:2){
    distances <- as.matrix(dist(rbind(centroids, X), method = "euclidean"))
    distances <- distances[1:nrow(centroids), (nrow(centroids) + 1):(nrow(centroids) + nrow(X))]
    assignments <- sapply(1:ncol(distances), function(i) {which.min(distances[,i])})

for (k in 1:5) {
    centroids[k,] <- colMeans(X[assignments == k,])
    }
}</pre>
```

3. I calculated the most likelihood (Gaussian) density of the hidden variable of the EM algorithm and updated the centroids as the initial mean values, then iterated over the algorithm 100 times:

```
while(i<100){
    covariances <- sapply(X = 1:5, FUN = function(k) {
        (t(X) - matrix(centroids[k,], 2, 300)) %*% diag(H[,k]) %*% t(t(X) - matrix(centroids[k,], 2, 300))/ sum(H[,k]) }, simplify = "array")
    priors <- colMeans(H)

H <- t(sapply(1:300, function(n){
        row <- sapply(1:5, function(k){density(X[n,], k)})
        return(row / sum(row))
}))

centroids <- (t(H) %*% X ) / matrix(colSums(H), 5, 2)
    i <- i + 1
}</pre>
```

4. Printed the centroid values:

```
[,1] [,2]
[1,] -2.50882875 2.56888718
[2,] 2.51478346 -2.61408096
[3,] -0.01262437 0.04159552
[4,] -2.66784042 -2.37667828
[5,] 2.32119796 2.58704409
```

5. Plotted the clustering results along with the original densities, results were as shown below:
